Certificate, Computer Operating Systems

Ahmed Chawki (Jun 2014)
Baccalaureat, Physics

PROJECTS

iGamer - Android Application
This project is an Android gaming app that prioritizes gameplay by minimizing disruptions and optimizing network connection. It includes features like gaming mode, intelligent monitors, call/notifications blocker, customization options, and advanced screen recorder.
JAVA Android, CodeIgniter, PHP, RestAPI, JWT, MySQL

ORS - Web App (user/admin) and Android App
This project is an online service that provides free SMS reception using temporary phone numbers. It utilizes various technologies such as PHP, Java for Android development, RestAPI, JWT for authentication, CodeIgniter framework, MySQL database, ReactJS for frontend development, and Node.js for server-side scripting. The service allows users to select from a range of international phone numbers in different countries to receive SMS messages.
PHP, JAVA Android, RestAPI, JWT, CodeIgniter, MySQL, ReactJS, NodeJs

AI Writer - An article generator (open source)
This open-source project utilizes React, Node.js, MongoDB, and JWT to create a blog automatically by inputting targeted keywords. It integrates the OpenAI API to generate content for the blog based on the provided keywords.
React, Node Js, MongoDB, JWT

EasyRate - Android Library (open source)
This open-source project is an AVA Android library that simplifies the process of managing app ratings and reviews on the Google Play Store. It provides a modern and well-designed dialog box for users to rate the application and provide feedback. The project utilizes Git for version control and Jitpack for dependency management.
JAVA Android, Git, Jitpack

EasyAd - Android Library (open source)
This open-source project is an AVA Android library that simplifies the integration of advertising networks for Android applications. It provides functionality to easily incorporate both third-party advertising networks and in-house advertisements. The library also includes features to remotely manage the advertisements from a server. The project utilizes Git for version control, Jitpack for dependency management, PHP CodeIgniter for server-side scripting, MySQL for database management, and JWT for authentication.
